Dealers are in SHORT GAMMA with net GEX of \$-3754.61B. Spot (6,563) sits 1.3% below the gamma flip level (6,648). Composite macro score: -0.11 → Risk Level: EXTREME. Key risks: BEARISH\_VOL\_BUY, WARNING: NEAR FLIP, BEARISH\_SKEW\_HEAVY.

## REGIME PLAYBOOK

▲ EQUITIES  
Reduce net delta, buy downside puts for protection

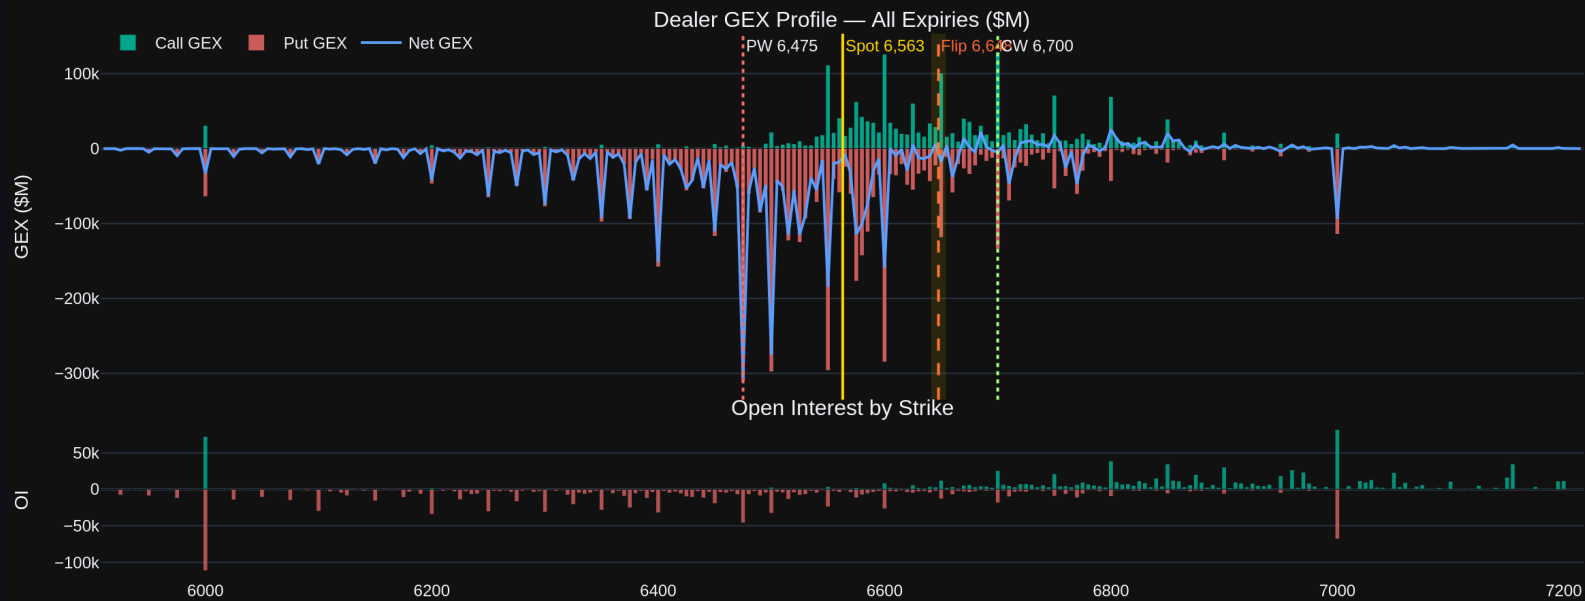

◆ VOLATILITY  
Long VIX, buy volatility — trend moves may persist

◆ OPTIONS STRATEGY  
Long straddles, buy gamma for directional exposure

◆ POSITION SIZING  
Reduce 30–50% — elevated tail risk in short-gamma regime

GEX Profile — Dealer Gamma Exposure

March 24, 2026

KEY LEVELS

| STRIKE | TYPE      | GEX     | DIST. FROM SPOT | INTERPRETATION                                            |
|--------|-----------|---------|-----------------|-----------------------------------------------------------|
| 6,700  | Call Wall | +128.9B | +2.1%           | Strong resistance / dealer selling above spot             |
| 6,600  | Call Wall | +126.1B | +0.6%           | Strong resistance / dealer selling above spot             |
| 6,550  | Call Wall | +111.5B | -0.2%           | Below-spot call concentration / dealer buyback support    |
| 6,475  | Put Wall  | -310.9B | -1.3%           | Downside accelerator / dealer selling pressure below spot |
| 6,500  | Put Wall  | -298.0B | -1.0%           | Downside accelerator / dealer selling pressure below spot |
| 6,550  | Put Wall  | -296.1B | -0.2%           | Downside accelerator / dealer selling pressure below spot |

| \$+0M            | 0.0%            |

# Expiry Roll-Off & Delta Exposure

March 24, 2026

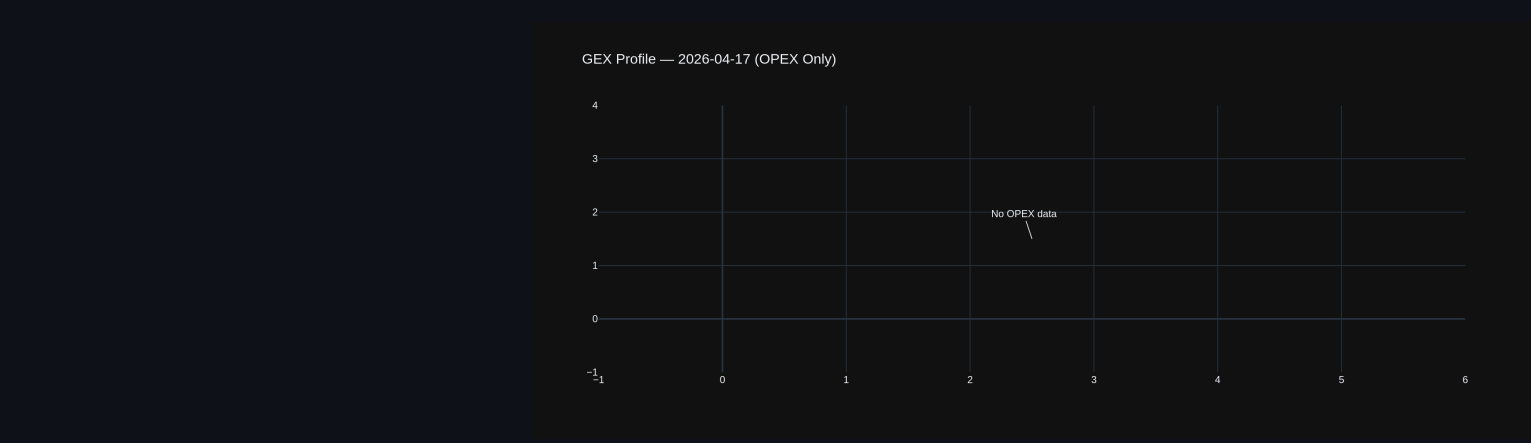

## GEX BY EXPIRY

## DEX PROFILE

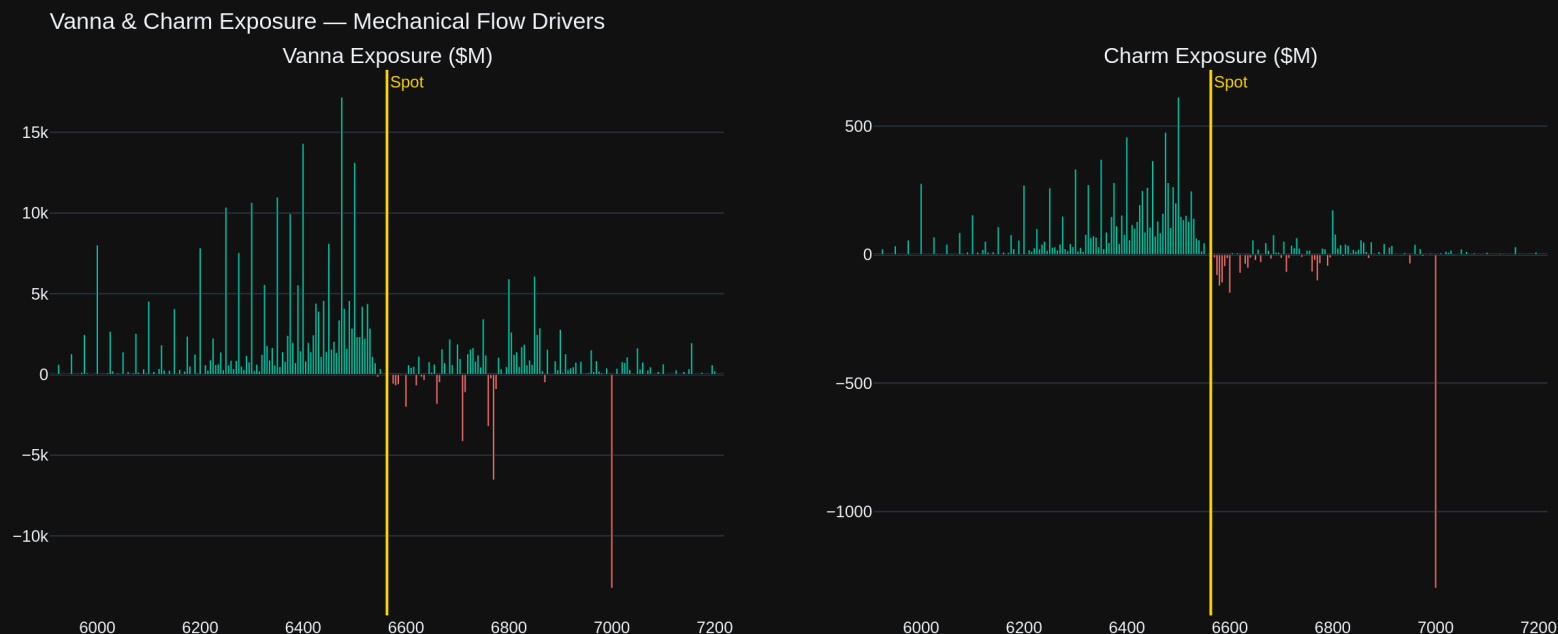

## OPEX-SPECIFIC GEX (2026-04-17)

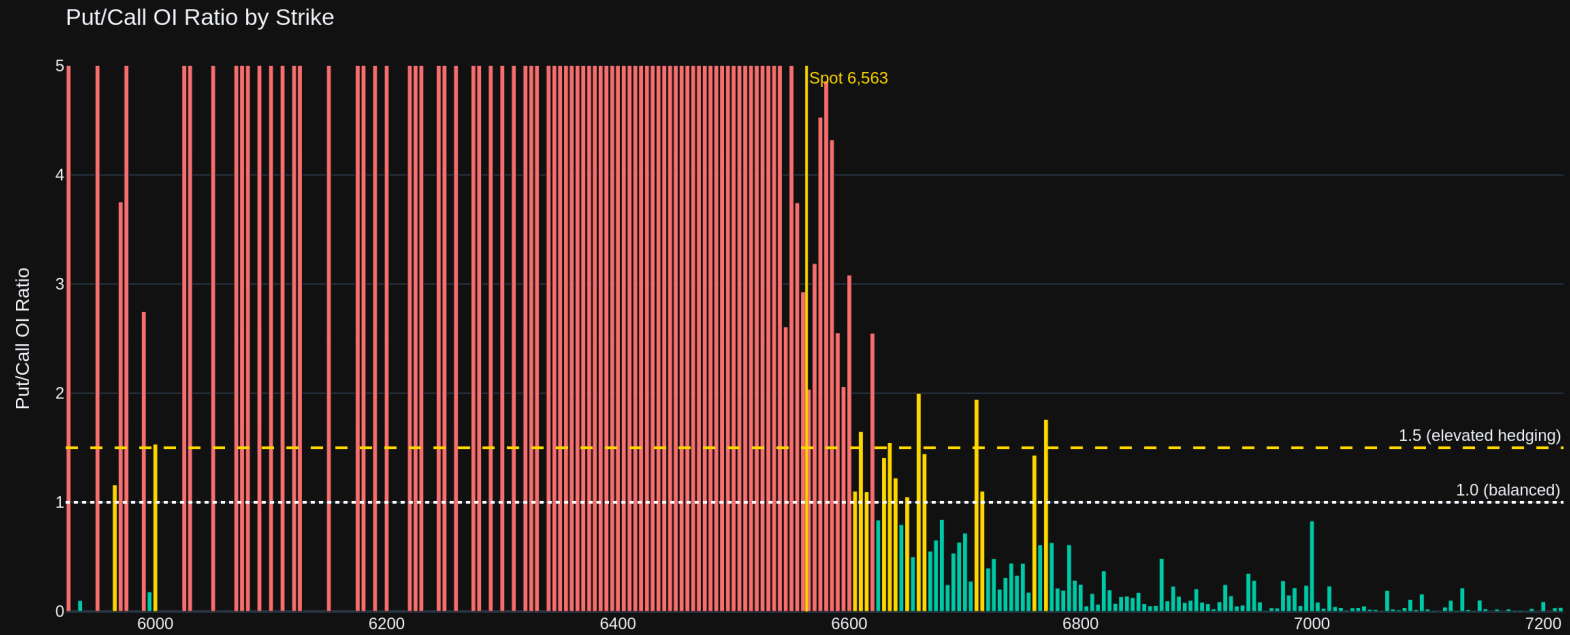

**Max Pain:** 6,625 — Market tends to gravitate toward max-pain strike in the final trading sessions before OPEX as dealers neutralise hedges.

## VANNA &amp; CHARM EXPOSURE

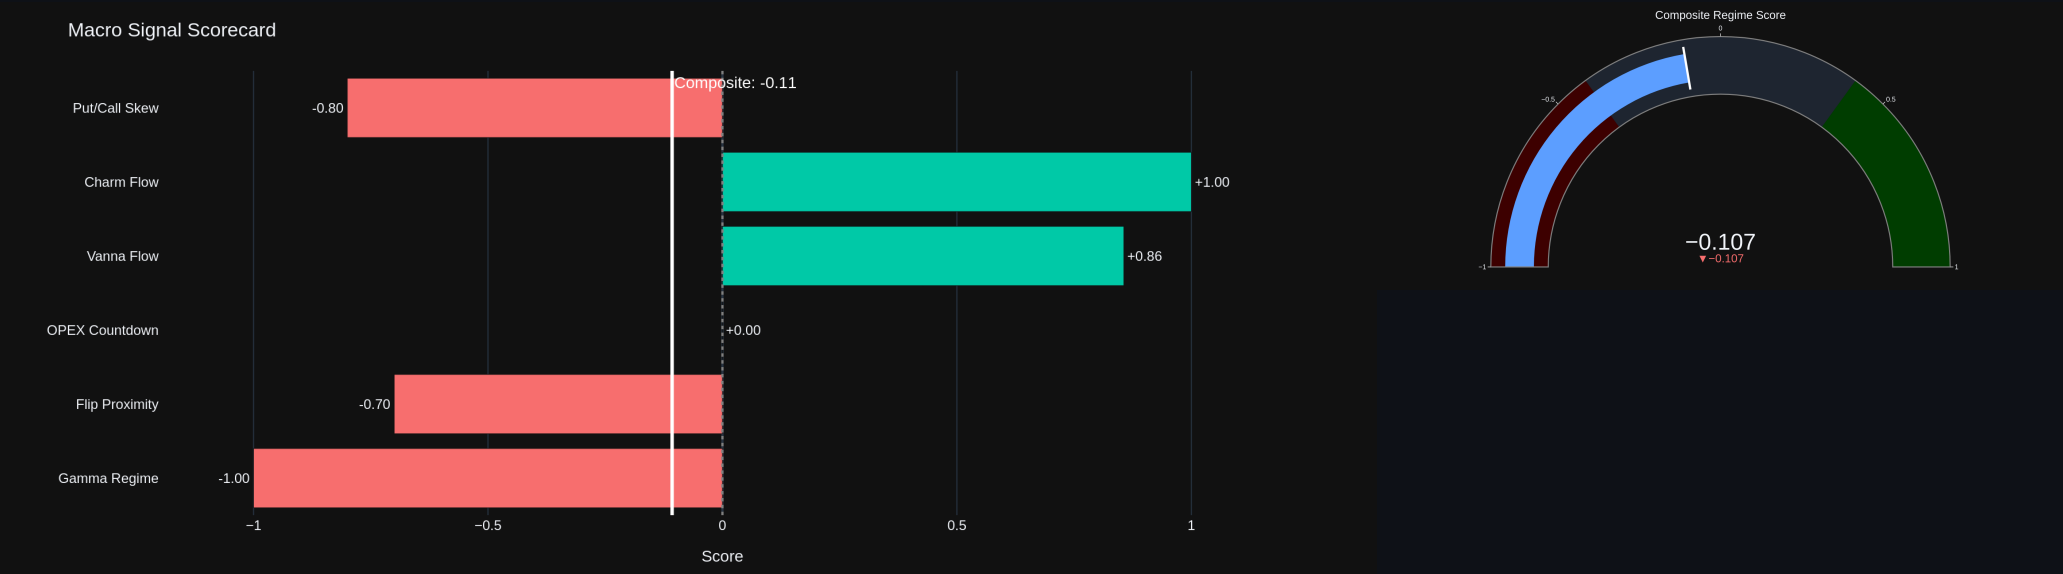

**Vanna ( $d\Delta/d\sigma$ ):** when implied vol changes, dealers mechanically re-hedge their delta. Positive net vanna exposure = vol compression creates systematic equity buying pressure. Negative net vanna = vol expansion creates systematic equity selling pressure. **Charm ( $d\Delta/dT$  per day):** delta decays daily with time even if price does not move. Near OPEX this effect accelerates sharply and can distort intraday price action.

## PUT/CALL OI RATIO BY STRIKE

**Put/Call OI Ratio (this chart):** open-interest-based ratio per strike. Strikes with OI ratio > 1.5 have heavy put accumulation relative to calls — typically defensive institutional hedging. Strikes near zero or NaN had insufficient call OI (< 10 contracts) and are suppressed. **Note:** the Put/Call Skew signal on the Signal Dashboard uses a separate *GEX-weighted* ratio (total put GEX / total call GEX), not this OI chart. The two metrics are related but not identical — OI ratio reflects positioning volume, GEX ratio reflects gamma exposure and dealer hedging pressure.

SIGNAL DETAIL

### Gamma Regime

BEARISH\_VOL\_BUY

-1.00

#### STRONG

Net GEX = \$-3754.61B → dealers are SHORT GAMMA. Spot is 1.3% below gamma flip at 6,648.

- Equities: trending moves more likely, reduce net delta exposure
- Vol: VIX spikes may persist — avoid short vol
- Options: long gamma / straddles for directional flexibility

### Flip Proximity

WARNING: NEAR FLIP

-0.70

#### MODERATE

Spot (6,563) is 1.29% from gamma flip (6,648). Risk of regime flip within the week.

- Watch 6,648 as key inflection — sustained close above = regime shift
- Volatility clustering risk increases near flip

### OPEX Countdown

UNKNOWN

+0.00

WEAK

No OPEX data available.

### Vanna Flow

VOL\_FALL\_BID\_DAMPENED

+0.86

#### STRONG

Vanna exposure = \$+293449M. Vol compression → mechanical equity bid via delta re-hedging. VIX 1d change: +0.72 (rising) — diverging with vanna signal.

- Vol decline → dealer delta re-hedging creates systematic equity buying
- Watch VIX 1d direction as leading indicator of vanna flow direction
- Strong positive vanna + falling VIX = powerful mechanical tailwind

### Charm Flow

DAILY\_DELTA\_INFLOW

+1.00

#### STRONG

Charm exposure = \$+9336M/day. DTE=0: charm acceleration is sharp near expiry. Positive charm = net delta accrual as time passes.

- Charm creates mechanical daily delta flows even with no price movement
- Near OPEX, charm accelerates and can distort intraday price action

### Put/Call Skew

BEARISH\_SKEW\_HEAVY

-0.80

#### STRONG

Put/Call GEX ratio = 2.74. Heavy put protection in dealer books — bearish defensive positioning. Put wall at 6,475 (-1.3% from spot).

- High put skew: dealers short puts → forced to sell into weakness, amplifying downside moves
- Hedging demand exceeds upside speculation — institutional risk-off signal

CROSS-ASSET GEX SUMMARY

| INSTRUMENT                     | SPOT     | NET GEX (\$B) | REGIME      | FLIP LEVEL | DIST. TO FLIP | CALL WALL | PUT WALL |
|--------------------------------|----------|---------------|-------------|------------|---------------|-----------|----------|
| SPX — S&P 500 Index            | 6,563.04 | -3754.61B     | SHORT GAMMA | 6,647.63   | -1.3%         | 6,700     | 6,475    |
| SPY — SPDR S&P 500 ETF         | 652.70   | -794.05B      | SHORT GAMMA | 660.72     | -1.2%         | 660       | 655      |
| QQQ — Invesco QQQ ETF          | 582.94   | -325.67B      | SHORT GAMMA | 590.43     | -1.3%         | 590       | 585      |
| IWM — iShares Russell 2000 ETF | 247.66   | -70.98B       | SHORT GAMMA | 250.61     | -1.2%         | 250       | 240      |

All instruments are in the same gamma regime — no cross-asset divergence detected. Monitor relative GEX levels and flip proximity for early signs of regime change.
