▼ SHORT GAMMA

RISK: EXTREME

Composite Score: -0.53

SPX SPOT 6,592	NET GEX -5140.84B	GAMMA FLIP 7,215	DIST. TO FLIP -9.4%	CALL WALL #1 6,650	PUT WALL #1 6,600
MAX PAIN 6,690			VIX 25.87		

Dealers are in SHORT GAMMA with net GEX of \$-5140.84B. Spot (6,592) sits 9.4% below the gamma flip level (7,215). Composite macro score: -0.53 → Risk Level: EXTREME. Key risks: BEARISH_VOL_BUY, BELOW FLIP: BEARISH, OPEX 1DTE, DAILY_DELTA_OUTFLOW, BEARISH_SKEW_HEAVY.

REGIME PLAYBOOK

▲ EQUITIES

Reduce net delta, buy downside puts for protection

◆ VOLATILITY

Long VIX, buy volatility — trend moves may persist

◆ OPTIONS STRATEGY

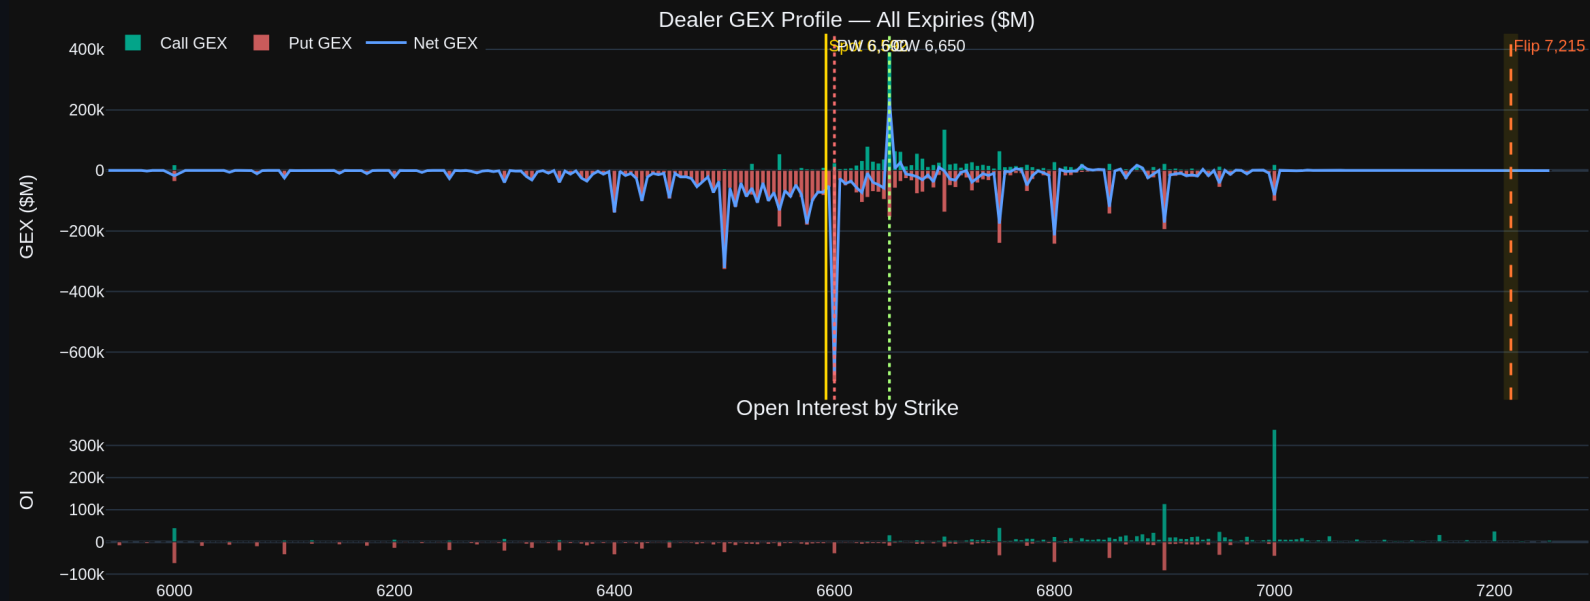

Long straddles, buy gamma for directional exposure

◆ POSITION SIZING

Reduce 30–50% — elevated tail risk in short-gamma regime

GEX Profile — Dealer Gamma Exposure

March 19, 2026

KEY LEVELS

STRIKE	TYPE	GEX (\$M)	DIST. FROM SPOT	INTERPRETATION
6,650	Call Wall	+391342M	+0.9%	Strong resistance / dealer selling above spot
6,700	Call Wall	+136048M	+1.6%	Strong resistance / dealer selling above spot
6,630	Call Wall	+79899M	+0.6%	Strong resistance / dealer selling above spot
6,600	Put Wall	-697225M	+0.1%	Overhead put concentration / pin risk above spot
6,500	Put Wall	-326638M	-1.4%	Downside accelerator / dealer selling pressure below spot
6,800	Put Wall	-243066M	+3.1%	Overhead put concentration / pin risk above spot

OPEX: 2026-03-20 (1 DTE)

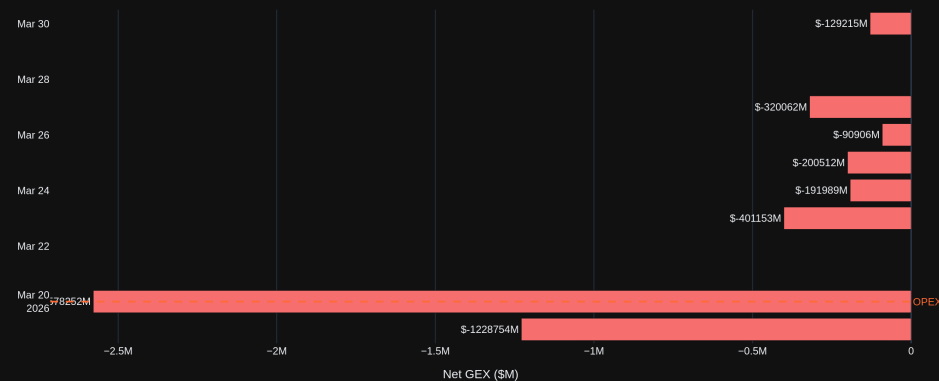

Net GEX Expiring	% of Total Book
\$-2578252M	50.2%

Expiry Roll-Off & Delta Exposure

March 19, 2026

GEX BY EXPIRY

Net GEX by Expiry — Roll-Off Profile (\$M)

DEX PROFILE

Dealer Delta Exposure (DEX) by Strike (\$M)

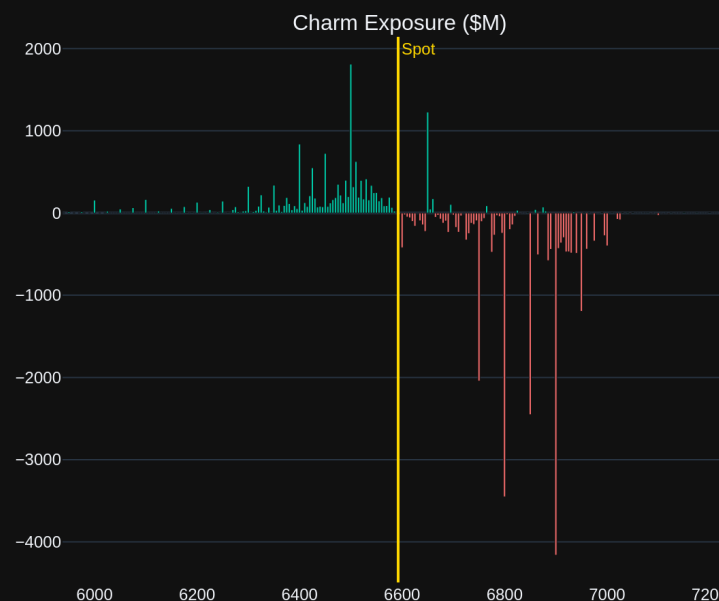

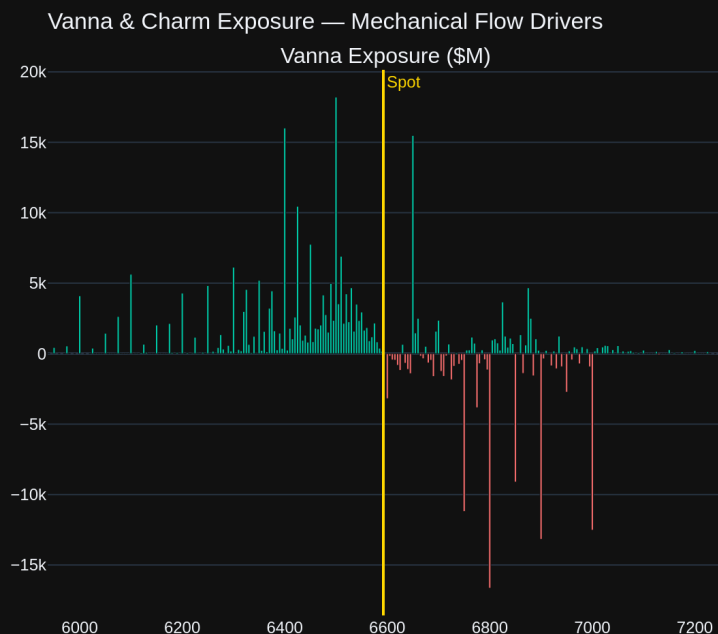

OPEX-SPECIFIC GEX (2026-03-20)

GEX Profile — 2026-03-20 (OPEX Only)

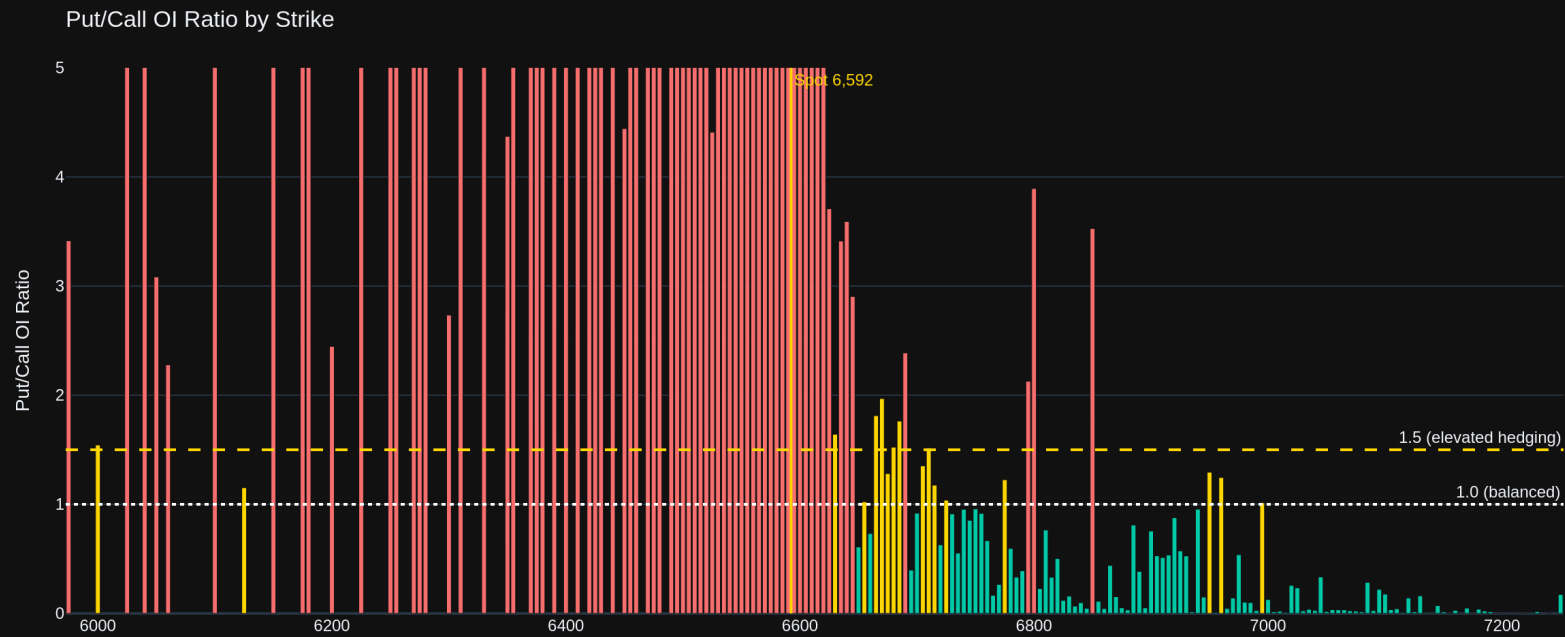

Max Pain: 6,690 — Market tends to gravitate toward max-pain strike in the final trading sessions before OPEX as dealers neutralise hedges.

VANNA & CHARM EXPOSURE

Vanna: $d\Delta/d\sigma$ — when vol changes, dealers re-hedge delta mechanically. Positive vanna = vol compression drives equity buying. **Charm:** $d\Delta/dT$ — daily delta decay creates intraday mechanical flows even without price movement. Strongest near OPEX.

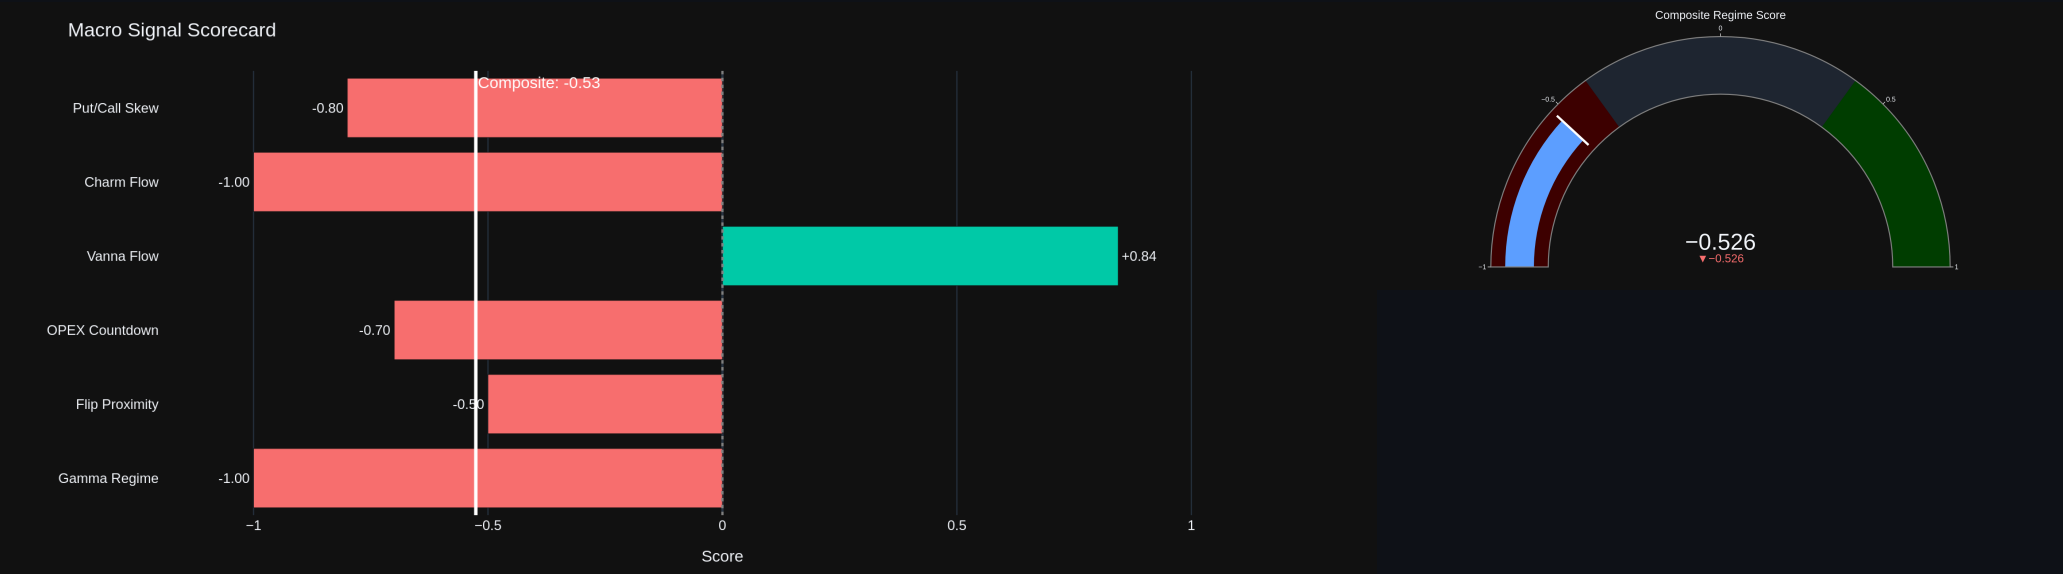

PUT/CALL OI RATIO

Put/Call Ratio: Values above 1.5 signal heavy defensive hedging by institutions. Put walls represent strikes with heavy short-put dealer exposure — dealer delta selling below these levels can accelerate declines.

Macro Signal Dashboard

March 19, 2026

SIGNAL DETAIL

Gamma Regime

BEARISH_VOL_BUY

-1.00

STRONG

Net GEX = \$-5140.84B → dealers are SHORT GAMMA. Spot is 9.4% below gamma flip at 7,215.

- Equities: trending moves more likely, reduce net delta exposure
- Vol: VIX spikes may persist — avoid short vol
- Options: long gamma / straddles for directional flexibility

Flip Proximity

BELOW FLIP: BEARISH

-0.50

MODERATE

Spot (6,592) is 9.4% below gamma flip (7,215). Dealers in short-gamma — trend-following mode, no natural support.

- Watch 7,215 as key inflection — sustained close above = regime shift
- Volatility clustering risk increases near flip

OPEX Countdown

OPEX 1DTE

-0.70

STRONG

OPEX in 1 DTE (CRITICAL urgency). \$-2578252M net GEX expiring = 50.2% of total book. Pin behaviour likely near OPEX strikes.

- Pin risk: market may gravitate to max-pain strike $\pm 0.5\%$ as OPEX approaches
- Post-OPEX: expect vol reset once large GEX concentration expires
- Book impact: 50.2% of dealer delta hedging unwind at OPEX

Vanna Flow

VOL_FALL_BID_DAMPENED

+0.84

STRONG

Vanna exposure = \$+155381M. Vol compression → mechanical equity bid via delta re-hedging. VIX 1d change: +0.78 (rising) — diverging with vanna signal.

- Vol decline → dealer delta re-hedging creates systematic equity buying
- Watch VIX 1d direction as leading indicator of vanna flow direction
- Strong positive vanna + falling VIX = powerful mechanical tailwind

Charm Flow

DAILY_DELTA_OUTFLOW

-1.00

STRONG

Charm exposure = \$-9020M/day. DTE=0: charm acceleration is sharp near expiry. Negative charm = net delta drain as time passes.

- Charm creates mechanical daily delta flows even with no price movement
- Near OPEX, charm accelerates and can distort intraday price action

Put/Call Skew

BEARISH_SKEW_HEAVY

-0.80

STRONG

Put/Call GEX ratio = 3.65. Heavy put protection in dealer books — bearish defensive positioning. Put wall at 6,600 (+0.1% from spot).

- High put skew: dealers short puts → forced to sell into weakness, amplifying downside moves
- Hedging demand exceeds upside speculation — institutional risk-off signal

CROSS-ASSET GEX SUMMARY

INSTRUMENT	SPOT	NET GEX (\$B)	REGIME	FLIP LEVEL	DIST. TO FLIP	CALL WALL	PUT WALL
SPX — S&P 500 Index	6,592.35	-5140.84B	SHORT GAMMA	7,215.00	-9.4%	6,650	6,600
SPY — SPDR S&P 500 ETF	658.40	-1480.74B	SHORT GAMMA	722.00	-9.7%	665	660
QQQ — Invesco QQQ ETF	591.45	-520.53B	SHORT GAMMA	648.00	-9.6%	600	590
IWM — iShares Russell 2000 ETF	244.86	-354.66B	SHORT GAMMA	267.50	-9.2%	245	240

All instruments are in the same gamma regime — no cross-asset divergence detected. Monitor relative GEX levels and flip proximity for early signs of regime change.
