Expiry Roll-Off & Delta Exposure

March 25, 2026

GEX BY EXPIRY

Net GEX by Expiry — Roll-Off Profile (\$M)

DEX PROFILE

Dealer Delta Exposure (DEX) by Strike (\$M)

OPEX-SPECIFIC GEX (2026-04-17)

GEX Profile — 2026-04-17 (OPEX Only)

Max Pain: 5,925 — Market tends to gravitate toward max-pain strike in the final trading sessions before OPEX as dealers neutralise hedges.

VANNA & CHARM EXPOSURE

Vanna ($d\Delta/d\sigma$): when implied vol changes, dealers mechanically re-hedge their delta. Positive net vanna exposure = vol compression creates systematic equity buying pressure. Negative net vanna = vol expansion creates systematic equity selling pressure. **Charm ($d\Delta/dT$ per day):** delta decays daily with time even if price does not move. Near OPEX this effect accelerates sharply and can distort intraday price action.

PUT/CALL OI RATIO BY STRIKE

Put/Call OI Ratio (this chart): open-interest-based ratio per strike. Strikes with OI ratio > 1.5 have heavy put accumulation relative to calls — typically defensive institutional hedging. Strikes near zero or NaN had insufficient call OI (< 10 contracts) and are suppressed. **Note:** the Put/Call Skew signal on the Signal Dashboard uses a separate *GEX-weighted* ratio (total put GEX / total call GEX), not this OI chart. The two metrics are related but not identical — OI ratio reflects positioning volume, GEX ratio reflects gamma exposure and dealer hedging pressure.

SIGNAL DETAIL

Gamma Regime

BULLISH_VOL_SELL

+0.28

WEAK

Net GEX = \$+0.57B → dealers are LONG GAMMA. Spot is 9.7% above gamma flip at 5,920.

- Equities: expect mean-reversion, sell strength into resistance
- Vol: VIX likely to fade on spikes — sell vol spikes
- Options: credit spreads / iron condors favoured

Flip Proximity

ABOVE FLIP: STABLE

+0.20

WEAK

Spot (6,556) is 9.7% above gamma flip (5,920). Dealer support likely on dips toward flip.

- Watch 5,920 as key inflection — sustained close above = regime shift
- Volatility clustering risk increases near flip

OPEX Countdown

UNKNOWN

+0.00

WEAK

No OPEX data available.

Vanna Flow

VOL_RISE_OFFER_DAMPENED

-0.02

WEAK

Vanna exposure = \$-14M. Vol expansion → mechanical equity selling via delta re-hedging. VIX 1d change: -1.95 (falling) — diverging with vanna signal.

- Vol decline → dealer delta re-hedging creates systematic equity buying
- Watch VIX 1d direction as leading indicator of vanna flow direction
- Strong positive vanna + falling VIX = powerful mechanical tailwind

Charm Flow

DAILY_DELTA_OUTFLOW

-0.04

STRONG

Charm exposure = \$-2M/day. DTE=0: charm acceleration is sharp near expiry. Negative charm = net delta drain as time passes.

- Charm creates mechanical daily delta flows even with no price movement
- Near OPEX, charm accelerates and can distort intraday price action

Put/Call Skew

NEUTRAL_BALANCED

+0.20

WEAK

Put/Call GEX ratio = 0.00. Balanced put/call book — no strong directional skew. Put wall at 5,905 (-9.9% from spot).

- High put skew: dealers short puts → forced to sell into weakness, amplifying downside moves
- Hedging demand exceeds upside speculation — institutional risk-off signal

CROSS-ASSET GEX SUMMARY

INSTRUMENT	SPOT	NET GEX (\$B)	REGIME	FLIP LEVEL	DIST. TO FLIP	CALL WALL	PUT WALL
SPX — S&P 500 Index	6,556.37	+0.56B	LONG GAMMA	5,920.00	+9.7%	6,225	5,905
SPY — SPDR S&P 500 ETF	653.18	+0.00B	NEUTRAL	590.00	+9.7%	590	590
QQQ — Invesco QQQ ETF	583.98	+0.00B	NEUTRAL	570.00	+2.4%	571	530
IWM — iShares Russell 2000 ETF	248.78	+0.00B	NEUTRAL	224.00	+10.0%	224	224

All instruments are in the same gamma regime — no cross-asset divergence detected. Monitor relative GEX levels and flip proximity for early signs of regime change.
